Assignment 1011
Alright, service and data access object implementation time…

Outcomes
This assignment will affect your proficiency measures for outcomes 1a–1c, 3b–3d, and 4a–4f.

Background Reading
Aside from further delving into Tomcat, Hibernate, Jersey, and REST, Chapter 7 of the course text fills out key concepts in data modeling and design (the concepts there stick, regardless of the notation you prefer to use).

For Submission
The task is simple—fix one or more of the server-side issues in the Headmaster project:
https://github.com/dondi/headmaster/issues
Address the issue that has been assigned to you in class, and send me a pull request when you feel the issue has been fixed. Remember to keep your own clone up-to-date, because other concurrent work may be going on with the project. If the issue has been assigned to a group, work from the same fork/clone but commit under your own account, so that it is clear who did what. Let’s keep development in the open here—instead of sending me direct email, post comments to the relevant issue on the GitHub website. That way, everyone knows what is being discussed and can chime in on any issue if they wish.
